To whom it may concern

At Spitwater we always try to make an affordable reliable product for various industries. By doing this we aid certain industries to perform to a standard, unfortunately this is usually controlled by ability, how much time is allowed/quoted to do the job.

It's not often you find a company spending more, to better the outcome for the customer. In this instance we believe that this may be the case.

By using a hot water pressure cleaner in the cleaning process, the outcome will be a lot better than just using a cold-water pressure cleaner. It really is as simple to work out "what cleans your hands better, hot or cold water.... hot water of course". The problem with this is that it costs a lot more to purchase and to run a hot water pressure cleaner on an hourly basis, so a lot of companies choose only to use a cold-water pressure cleaner. Hence, they keep their initial purchase price and running costs down on a day to day basis.

The more we put into preparation the better the final result will be, plus it will outlast a job that isn't prepared properly. So, we feel by using a hot water pressure cleaner to do the preparation of a surface that is to be painted will give you a much better outcome. The household roof is one of the hardest things to get clean, because of what ends up on it and the temperature that it gets taken too on a daily basis.

Regards,

Spitwater SA
